

Product Requirements Document (PRD)

Product Name

(TBD)

Product Vision

Create a cross-platform personal knowledge management and productivity platform that seamlessly syncs across devices. The platform should allow users to store notes, images, links, tasks, reminders, and other important information in a clean, intuitive environment while offering optional AI-powered assistance and future agentic AI capabilities.

The goal is to create a modern digital second brain that helps users capture, organize, retrieve, and act on information effortlessly.

Core Product Objectives

The application should:

- Sync seamlessly across devices.
 - Provide a simple and intuitive user experience.
 - Allow storage of text, images, and links.
 - Support organization through custom categories.
 - Include task and reminder functionality.
 - Offer optional AI assistance.
 - Be architected for future agentic AI capabilities.
 - Maintain a clean and minimal design language.
 - Prioritize speed, accessibility, and ease of use.
-

Supported Platforms

The product should support:

- iOS
- Android
- Desktop browsers
- Tablets

The user experience should remain consistent across platforms while respecting platform-specific interaction patterns.

Account System

Authentication

Users must create an account to access synchronization features.

Supported sign-in methods:

- Google Sign-In
- Email and password authentication

Authentication should be:

- Secure
 - Fast
 - Easy to use
 - Available on mobile and web
-

User Profiles

Users should have:

- Cloud-based data storage
- Automatic synchronization across devices
- Personal settings management
- Theme and customization preferences

- AI preferences
-

Notes & Knowledge Management

Notes

Users should be able to:

- Create notes
 - Edit notes
 - Delete notes
 - Archive notes
 - Pin notes
 - Duplicate notes
 - Search notes
 - Sort notes
-

Rich Content Support

Notes should support:

Text

- Plain text
- Rich text formatting
- Headings
- Lists
- Checklists
- Links

Images

- Image uploads
- Drag-and-drop image insertion
- Multiple images per note
- Image captions
- Image descriptions

Mixed Content

Users should be able to combine:

- Text
- Images
- Saved links
- Tasks

within a single note.

Link Saving System

Users should be able to:

- Paste URLs directly into the application
- Save links for future reference
- Attach notes to saved links
- Categorize links
- Search saved links
- View link previews when available

Examples:

- Articles
 - Videos
 - Documentation
 - Research sources
 - Shopping links
 - Reference material
-

Organization System

Categories

Users should be able to create custom categories.

Examples:

- Gym
- Gaming
- Work
- Music
- School
- Personal
- Travel
- Business

Users should be able to:

- Create categories
- Rename categories
- Delete categories
- Reorder categories
- Assign colors/icons
- Move notes between categories

No hard limit should exist on the number of categories.

Search

The platform should provide powerful search functionality.

Users should be able to search by:

- Note title
- Note content
- Task names
- Categories
- Saved links
- Image metadata
- AI-generated tags (future feature)

Search should be fast and responsive.

Task Management

Tasks

Users should be able to:

- Create tasks
 - Edit tasks
 - Delete tasks
 - Complete tasks
 - Archive tasks
 - Assign priorities
 - Assign tasks to categories
 - Link tasks to notes
-

Task Priorities

Support:

- Low
 - Medium
 - High
 - Critical
-

Task Statuses

Support:

- To Do
 - In Progress
 - Completed
 - Archived
-

Reminder System

Reminders

Users should be able to create reminders for:

- Tasks
 - Notes
 - Events
 - Custom alerts
-

Reminder Options

Support:

Scheduling

- Date selection
- Time selection

Recurring Reminders

- Daily
- Weekly
- Monthly
- Yearly
- Custom schedules

Notification Types

- Push notifications
- Email notifications (optional)

All reminders must synchronize across devices.

Home Screen & Navigation

Startup Preferences

Users should be able to choose what appears when launching the application.

Available options:

Daily Note

Automatically open the note for the current day.

Last Opened Content

Return to the most recently viewed note or category.

Selected Category

Open a user-selected category every time.

Dashboard

Open a dashboard containing:

- Recent notes
 - Tasks
 - Upcoming reminders
 - Saved links
-

Dashboard

The dashboard should display:

- Recent notes
- Pinned notes
- Upcoming reminders
- Active tasks
- Recently saved links
- AI suggestions (if enabled)

The dashboard should be customizable.

AI Assistant (Optional Feature)

AI Enable/Disable

AI must be completely optional.

Users can:

- Enable AI
- Disable AI
- Choose AI behavior

AI should be disabled by default.

AI Features

When enabled, users can invoke AI within individual notes.

Capabilities include:

Writing Assistance

- Improve writing
- Rewrite text
- Expand ideas
- Brainstorm content

Summarization

- Summarize notes
- Summarize saved content
- Generate key takeaways

Research

- Provide additional information
- Conduct topic research
- Explain concepts
- Answer questions

Productivity

- Create task lists
 - Generate action items
 - Suggest priorities
-

AI Control

AI should:

- Only activate when requested
 - Never modify content automatically
 - Request confirmation before making changes
 - Respect user privacy settings
-

Agentic AI Architecture

Long-Term Vision

The application should be architected from the beginning to support advanced agentic AI systems.

The goal is to evolve beyond note-taking into a personal productivity operating system.

Agent Framework

The system should support future AI agents that can perform actions rather than simply answering questions.

Examples include:

Research Agent

Can:

- Research topics
 - Gather information
 - Summarize findings
 - Save research directly to notes
-

Organization Agent

Can:

- Categorize content
 - Suggest organizational improvements
 - Detect duplicates
 - Recommend folder structures
-

Task Agent

Can:

- Create task plans
 - Break down large goals
 - Suggest timelines
 - Generate reminders
-

Knowledge Agent

Can:

- Analyze stored information
 - Answer questions based on user notes
 - Connect related ideas
 - Surface forgotten information
-

Workflow Agent

Can:

- Execute multi-step workflows
 - Coordinate actions across the platform
 - Complete approved tasks automatically
-

Agent Infrastructure Requirements

The architecture should include:

AI Service Layer

Separate AI functionality from core application logic.

Tool-Based Architecture

Future agents should interact through tools capable of accessing:

- Notes
 - Tasks
 - Reminders
 - Categories
 - Saved links
 - Images
 - Settings
-

Permission Framework

Users must be able to:

- Enable agents
 - Disable agents
 - Review actions
 - Approve actions
 - Restrict access to specific features
-

Agent Activity Log

All AI actions should be:

- Logged
 - Reviewable
 - Transparent
 - Reversible whenever possible
-

Design System

Design Philosophy

The application should follow:

- Minimalistic design
- Flat 2D interface style
- Clean visual hierarchy
- Simple interactions
- Consistent design language

The interface should feel:

- Modern
 - Fast
 - Elegant
 - Lightweight
 - Uncluttered
-

Color System

Default Theme

Primary Background

Soft cream color.

Accent Color

Orange.

Orange should be used for:

- Buttons
- Active states
- Navigation highlights
- Important actions
- Selection indicators

Theme System

Light Mode

Default experience.

Cream-based interface with orange accents.

Dark Mode

Must include:

- Full dark theme
 - Automatic system detection
 - Manual theme switching
-

Accent Color Customization

Users should be able to change accent colors.

Examples:

- Orange (default)
- Blue
- Green
- Purple
- Red
- Teal
- Pink

Changes should apply throughout the entire application.

User Experience Requirements

The application should be:

- Easy to learn
- Easy to navigate
- Fast to use
- Accessible
- Consistent

Users should be able to perform common actions with minimal clicks or taps.

Performance Requirements

The platform should:

- Launch quickly
- Load notes instantly
- Sync reliably
- Handle large note collections
- Maintain responsiveness

Synchronization should feel near real-time whenever possible.

Security & Privacy

The platform should:

- Encrypt user data in transit
- Securely store user data
- Protect account information
- Give users control over AI access

Users should clearly understand:

- What data is stored
- What AI can access
- What actions AI can perform

Future Expansion

The architecture should support future additions such as:

- Team collaboration
 - Shared workspaces
 - Real-time collaboration
 - File attachments
 - PDF support
 - Audio support
 - Video support
 - Calendar integration
 - Browser extension
 - Offline mode
 - AI-powered categorization
 - Voice notes
 - Knowledge graphs
 - Multiple AI providers
 - API integrations
 - Workflow automation
 - Retrieval-Augmented Generation (RAG)
 - Long-term memory systems
 - Autonomous agent workflows
-

Success Criteria

The finished product should feel:

- Fast
- Modern
- Minimal
- Organized
- Intelligent
- Reliable
- Beautiful
- Effortless to use

The platform should become the user's primary place to capture information, organize knowledge, manage tasks, store ideas, and eventually leverage AI agents to help get work done while remaining fully under user control.
